 Projects

[Real Estate Project]

We used **Spring Boot** and **Next.js** technologies. In this project, we designed a secure **REST API** with Spring Boot and integrated it with a **PostgreSQL** database. I developed and implemented the login functionality, managing **user authentication and authorization** processes.

[Stock Application]

For the backend, I designed a clear and maintainable structure using the **Django** framework. After testing the system with **Postman**, I built the frontend with **React**, styling the layout according to the client's specifications.
